

Types of Variables

- Basically, there are three types:
 - User-defined-Variables
 - These are the variables defined by us while developing shell scripts
 - System-defined-Variables
 - System-defined-Variables are default variables
 - System-defined-Variables can get using **set** command
 - System-defined-Variables are defined in CAPITAL LETTERS
 - Note: Its better to avoid user-defined-variables in terms of CAPITAL LETEERS
 - Special Variables
 - Special variables are like \$?, \$\$, \$@, \$*
